A Leakage-Controlled Cold-Start Benchmark for Drug-Combination Synergy Classification on DrugComb v1.5

The DrugComb v1.5 source summary file used in this study is available from Zenodo record 15235991 (<https://zenodo.org/records/15235991>). The derived modeling table, preprocessing and analysis code, metric outputs, and BMC submission materials are publicly available in the GitHub repository <https://github.com/xulinpan/bmc>. The modeling table was generated locally from the public DrugComb summary file using the preprocessing script described in the Methods; no restricted, patient-identifiable, or newly collected human participant data were used. The repository includes the analysis code for preprocessing, model training, the standard and cold-start evaluation regimes, the no-study, leave-study-out, and leave-tissue-out robustness experiments, the Morgan-fingerprint structure-baseline scaffold, and the bootstrap, permutation, and figure-generation scripts, together with the metric outputs needed to reproduce the reported numbers. Programming language: Python 3.10 or later. All experiments were run with fixed random seed 42.
